20. (Currently Amended) A method for brightening a chemical pulp comprising the steps of:

mixing pulp containing less than 18% lignin with hydrogen peroxide, an aqueous solution of sodium silicate, wherein sodium silicate comprises sodium oxide (Na_2O) and silica (SiO_2); an alkali agent added in an amount sufficient to maintain the pH of said solution at least about 8; and a

magnesium compound which dissociates in said solution to form $\text{Mg}(\text{OH})^+$ cations, wherein said magnesium compound is added in an amount to achieve, along with any other dissociated magnesium, an $\text{Mg}:\text{SiO}_2$ mass ratio of between about 1:~~15~~10 to about 1:23, to form a mixture, and wherein at least 25% of the silicates SiO_2 have has a molecular weight of at least 10,000 Daltons; ~~and~~

pressurizing said mixture with an oxygen-containing gas; and

heating said mixture to allow said mixture to react to cause a portion of said lignin to degrade.
